iProMOH - Intelligent Music and Message Announcer

Product Overview

iProMOH is a solid state music and message announcer specifically designed for on-hold messaging, background music, and overhead paging applications. It is excellent for businesses that wish to promote products and services to on-hold customers in a general business environment or a call queue in a call centre, and it can work either as a single-site solution or part of a multi-site environment.

iProMOH turns a public address system into a powerful marketing tool by playing messages and music to entertain and inform shoppers and/or workers.

iProMOH has 5 main benefits:

1. It plays music and messages for on-hold callers:

You can use the iProMOH to play messages and/or music to callers that are put on hold, entertaining and educating them about new products, advertising or frequently asked questions.

2. It plays overhead announcements:

The iProMOH turns your public address system into a powerful marketing tool by playing messages to introduce products or services, answer questions, or promote store campaigns and advertising.

3. It plays background music:

The iProMOH is a great device for playing background or foreground music to entertain shoppers at your business.

4. It's a flexible single or multi-site solution:

The iProMOH is available in single site or multi-site configuration and can be administered remotely via the internet from Telemallaudio's host system. One or more sites can be remotely configured, messages & music refreshed and message schedules changed - without the need for client intervention.

5. It will work with your phone system:

iProMOH's plug'n play design and network interface ensures it will easily operate with vast majority of new or existing telephone systems.

4. It's a flexible single or multi-site solution:

The iProMOH is available as a single site unit with administration done directly at the

unit via a network connection from a PC. Or with the optional iCAS administration

software for multi-site management, an iProMOH can be administered remotely via the internet from a host system.

Note: You must have one copy of the iCAS software installed in your network for an

iProMOH network to run. This iCAS can manage one or more iProMOH units on the network.

5. It will work with your phone system:

The iProMOH's plug'n play design and network interface ensures it will easily operate with any new or existing telephone system.
